INDITION COMMERCE

Bulk Inventory Settings

Feature List — everything the Sub-Product Inventory tab of Bulk Products Update does.

Version V5 · October 2026

Settings you can change in bulk

- **Enable Serial Number Tracking** — on or off for every selected SKU.
- **Enable Fractional / Decimal Quantities** — on or off, when your store sells fractional quantities.
- **Pre-Cut Settings** — source SKU, unit of measure and fractional size, written together, when Pre-Cuts is on.
- **Reorder Point** at the locations you choose.
- **Min Qty** at the locations you choose, with decimals for SKUs sold in fractional quantities.
- **Max Qty** at the locations you choose, with decimals for SKUs sold in fractional quantities.
- **Lead Time Days** at the locations you choose.
- **Safety Stock** at the locations you choose.

Choosing what changes

- A **Change** switch for every setting: only switched-on settings are written.
- Values are set exactly: the number you enter is the number the SKUs end up with.
- A location picker grouped by store, with filtering, Select All and Clear.
- Bins shared by several stores listed once, under the store that owns them.
- A single-location store shown as a fixed location, with nothing to pick.
- Planning created automatically for a SKU that has none at a chosen location.
- The tab shows only the settings your store has switched on: fractional and Pre-Cut settings follow Inventory Settings.

Choosing the SKUs

- The same product grid as every sub-product tab: tick SKUs, or apply to everything a filter shows.
- The grid title repeats the change you are about to make.
- **Select Products** stays disabled until every switched-on setting has a valid value and planning has a location.

Safe by design

- Serial number tracking turns on only where your **Serialization Enable Rule** allows it, SKU by SKU.
- Decimal Min / Max apply only to SKUs sold in fractional quantities.
- Max Qty can never be set below Min Qty.
- A Pre-Cut source or target always has a unit of measure; a target always has an active size.
- SKUs that do not track inventory, or whose product type Inventory does not manage, are never changed.
- A refusal on one SKU never stops the others, and never leaves that SKU half-changed.

Results you can read

- A count of SKUs updated, and of SKUs that already had the settings.
- A table of skipped SKUs with product name, variant, SKU and reason, each SKU linked to its page.

Scheduling

- **Schedule Future Updates** in 15-minute steps, one scheduled change per SKU.
- Scheduled changes listed on each SKU's Scheduled Changes tab and under Scheduled Product Changes.
- At run time only the scheduled fields are written; anything else changed in the meantime is kept.

History and undo

- Every update recorded as a **Sub-Product Inventory** batch in Bulk Update Batches.
- **Rollback Row** and **Rollback Batch**, with planning rows the update created removed again.
- Every SKU's History lists each inventory setting before and after, with **Restore** per field.
- History shows serial number, fractional, Pre-Cut and planning changes made in bulk, by schedule or by rollback.

Related improvements

- Bulk **Enable Inventory Tracking** off marks SKUs untracked; on sets up their stock records, as the SKU page does.
- The same tracking rules for scheduled changes, undo and the Manage Inventory bulk action.
- The SKU's Inventory Settings tab shows Pre-Cut fields only when Pre-Cuts is on, and keeps the Pre-Cut setup when saved without them.
- Pre-Cut Unit Of Measure and Fractional Size always visible on the SKU tab, so target SKUs can be set up.
