Kits and Kit Builds Setup Guide

What a site needs before staff can create kits, build them into stock and sell them.

Before you start

A kit is a product of your store, with its own SKU, its parts and its type. Assembled kits are built into stock and taken apart on **Inventory > Kit Builds**, so inventory must be switched on for the stores that will build kits.

Who can use it

Kit Builds, Create Kit, Build Kits and Take Kits Apart are Inventory screens: staff who can use the Inventory screens can use them. The kit's product and SKU follow the product screens' access.

Have these ready

- **Product types.** Create Kit offers every active product type and picks the one marked as the default. Categories and pages are filtered by the type, as on the product screen.
- **Categories.** Every kit needs at least one category of its product type.
- **A product page.** The web store page that shows a product of that type, for example *Product Detail Page*.
- **Stores.** Every store is offered and ticked; untick the ones that should not sell kits.
- **Vendors.** Each kit SKU needs an active vendor.
- **Parts in stock.** An assembled kit is built from parts in stock. Receive them on a purchase order or a stock adjustment first. A part that does not track inventory is counted at its purchase cost and moves no stock.
- **Locations.** Build Kits takes parts from, and puts kits into, the active locations of active warehouses.

Receipts

Choose how kit parts print on POS receipts.

1. **POS Settings > Receipt > Kit contents**: one line, each part on its own line, or off. This is for receipts with no Receipt Designer layout.
2. A Receipt Designer layout sets its own under **Items > Kit contents**.
3. A kit set to always or never list its parts (**Products > SKU Breakdown**, the kit's Parts on receipt) prints that way everywhere.

Check it works

1. Open **Inventory > Kit Builds** and press **Create Kit**.
2. Fill in step 1 and step 2 with a test kit, choose **Assembled kit**, and press **Add parts to the kit**.
3. On the kit's **Kit SKUs** tab, assign two parts that are in stock.
4. On Kit Builds, open **Actions > Build Kits**, choose the kit, build one, and check the build's page.
5. Take that kit apart again from **Actions > Take Kits Apart**, then remove the test product if you do not need it.
